

Enriched Sacred Frankincense for Terminal or Advanced Cancer

by Young Living Hong Kong on Monday, September 17, 2012 at 10:48am ·

The enriched formula is derived from Sacred Frankincense. Here are the steps.

- If you start with a 15 ml bottle, you want to reduce the final volume to 3 ml by "evaporating" 80% of the original volume. The process needs to be done at room temperature (a very slow process) or up to 55 oC. You might want to use a glass container with wider opening to speed up the process. Also, you do NOT want to have any temperature higher than 55 oC for 2 reasons. First, frankincense oil is flammable; and second, high molecular weights compounds which are important for anti-cancer activity will be "evaporated" at higher temperature. The left over from higher temperature evaporation will have dramatically reduced biological activity.
- If you start with a larger volume, say 1 liter, you can transfer it in a 1-2 liter glass beaker. Put it on a magnetic stirrer (or hot plate stirrer). Set the temperature at 55 oC or monitor the temperature with a thermometer. Also set stirring speed at 150 rpm.
- For patients with advanced stages, patients need to take 0.2 ml/kg body weight/day; and divide the calculated volume equally for 3-4 times a day. Take the volume after meal.
- Patients shall see positive responses within 10-14 days. Patients need to take the volume continuously until no sign of cancer in two consecutive CT or other scans. We expect that tumor would have dramatically reduced sizes by 20-30% in approximately 4 weeks. Based on our estimate, patients might need to take the enriched formula continuously for 90-120 days, depending on patients' conditions.
- Please monitor patients' liver and kidney functions by blood tests. Although Dr. Suhail told me that all of his patients did not have liver or kidney complications, everyone patient is different.
- If the patient has never been exposed to frankincense before, he/she might experience lightheadedness, gastrointestinal irritations, and/or diarrhea. If any of this happens, simple start the volume by giving 0.1 or even 0.05 ml/kg/day, and slowly increase the volume to 0.1 ml/kg/day.
- Dr Lin is working on 3 patients in the US now with the formula, and have medical records from a 13-year-old girl with stage 4 renal cell carcinoma after taking the enriched formula 5 weeks. He will release her information after they do not see any sign of cancer in her body.
